

WANTED: SIMULATIONS IN NEED OF A SURROGATE

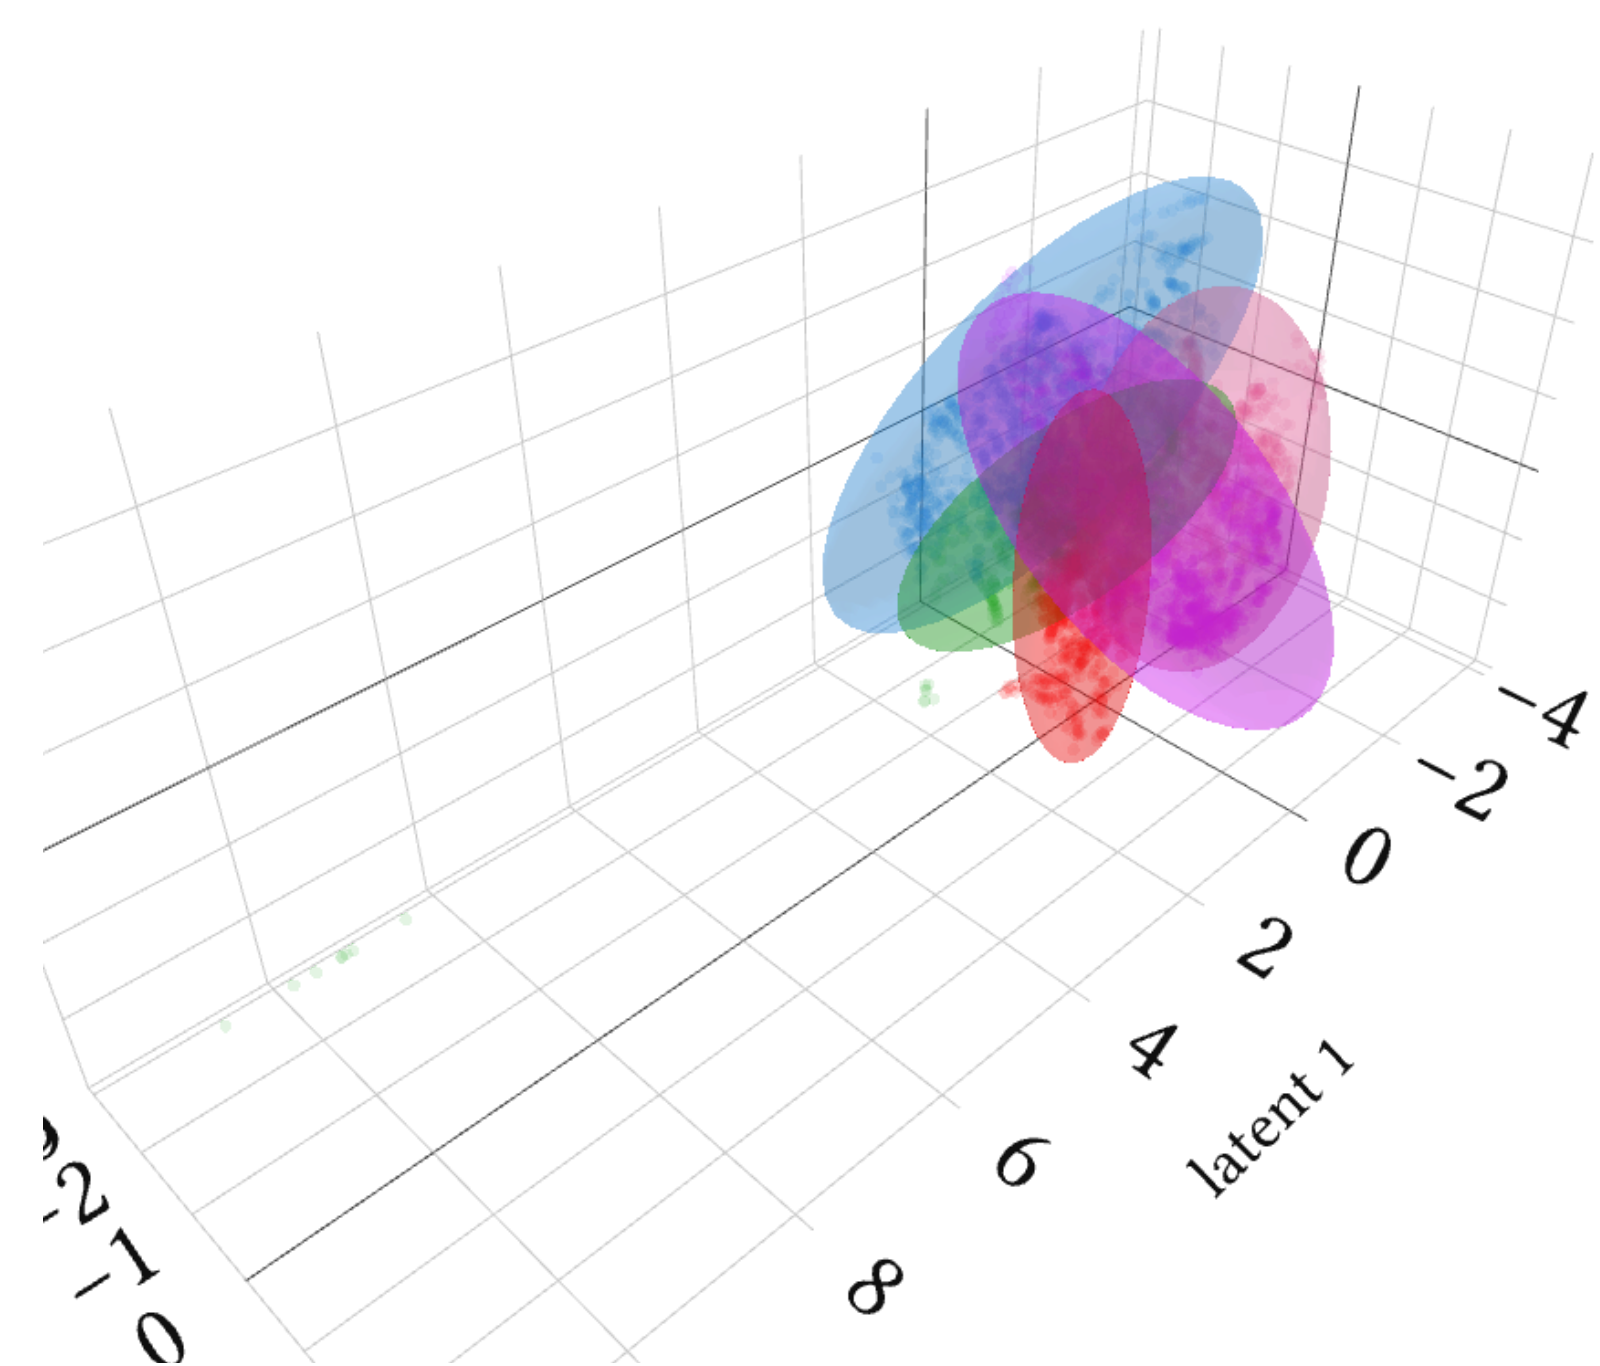

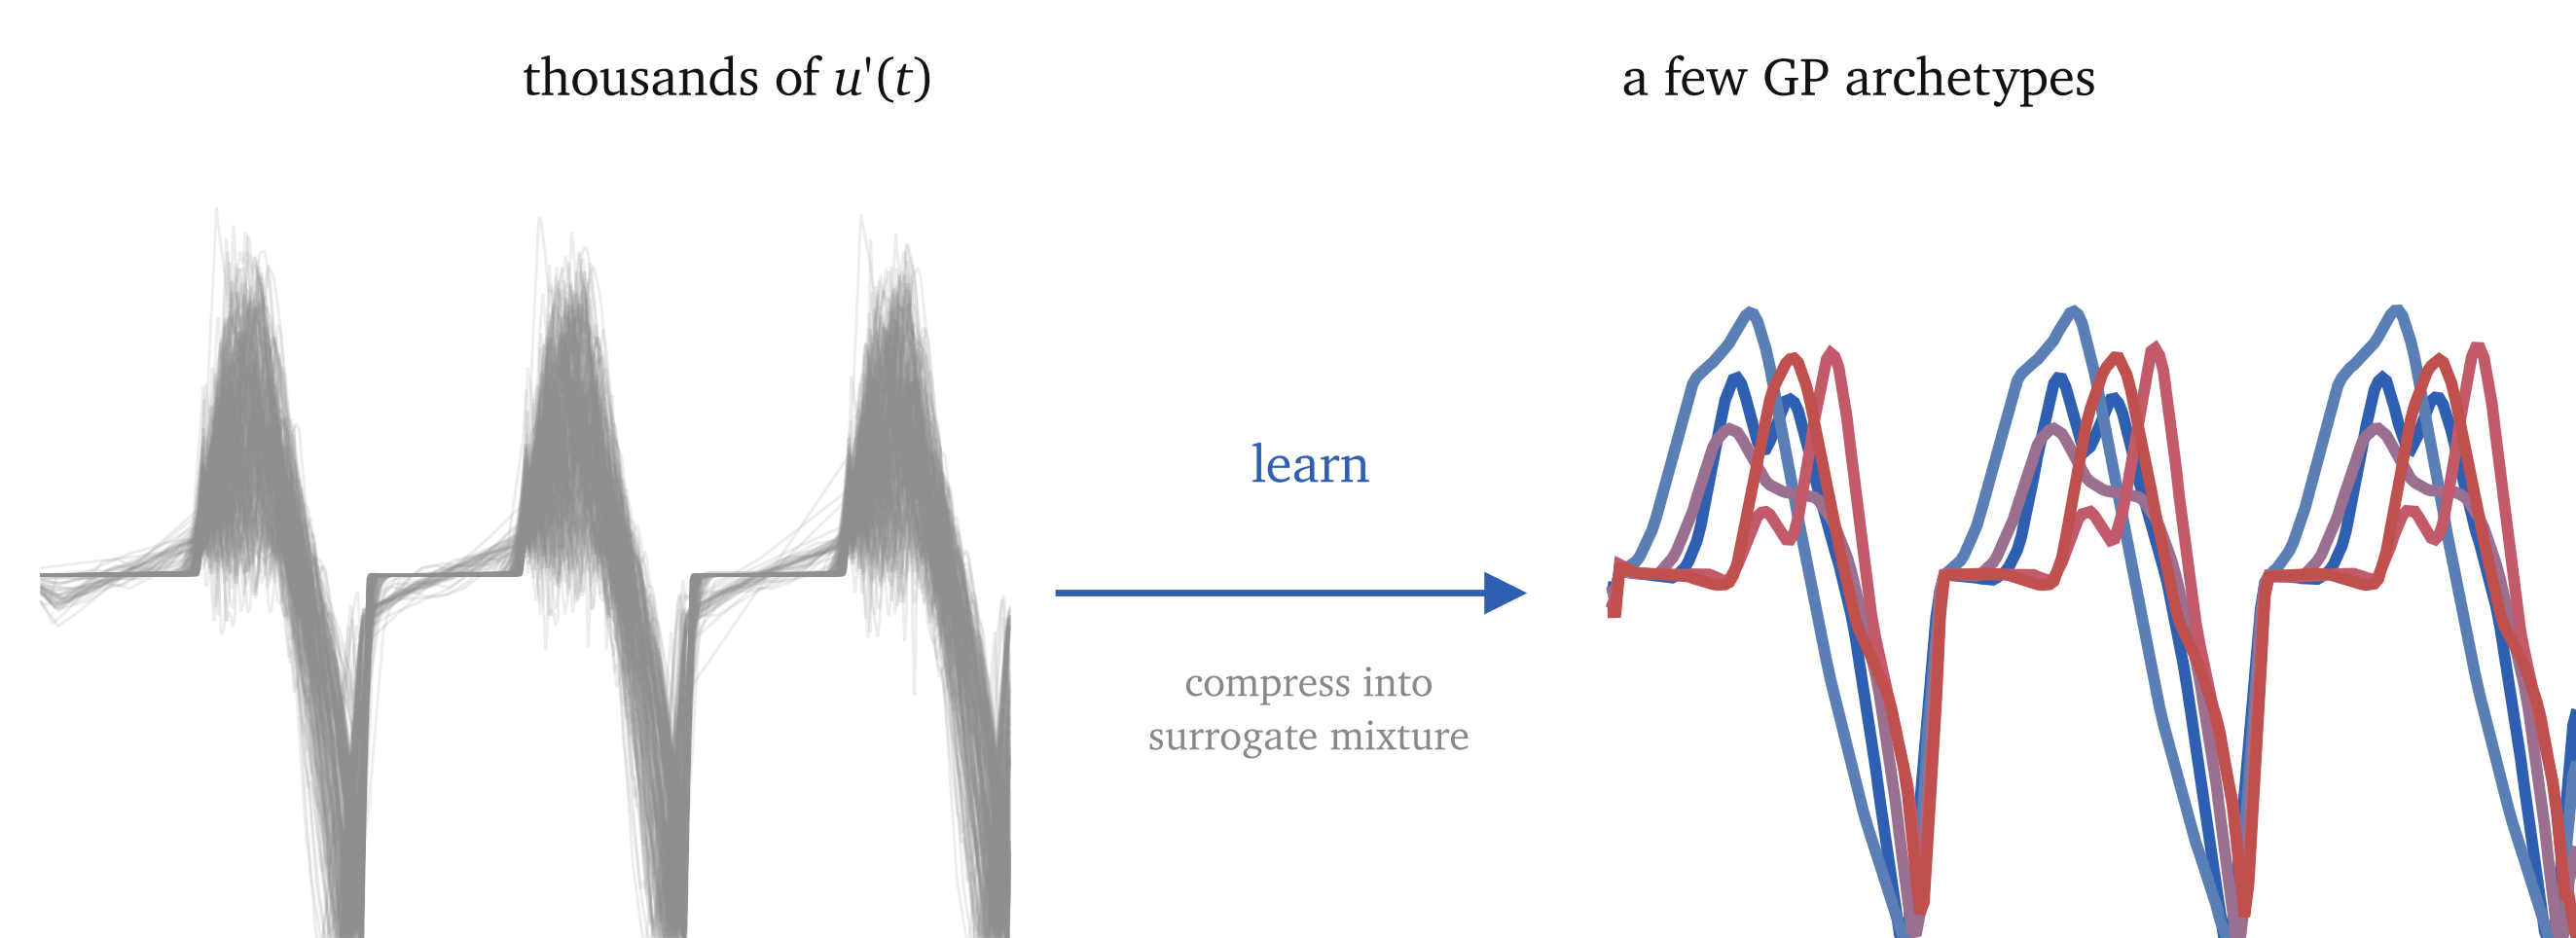

THOUSANDS OF SLOW SIMULATIONS...

High-fidelity vocal fold simulations: hours of compute, one airflow cycle each.

...BECOME A 3-D MAP WITH ERROR BARS

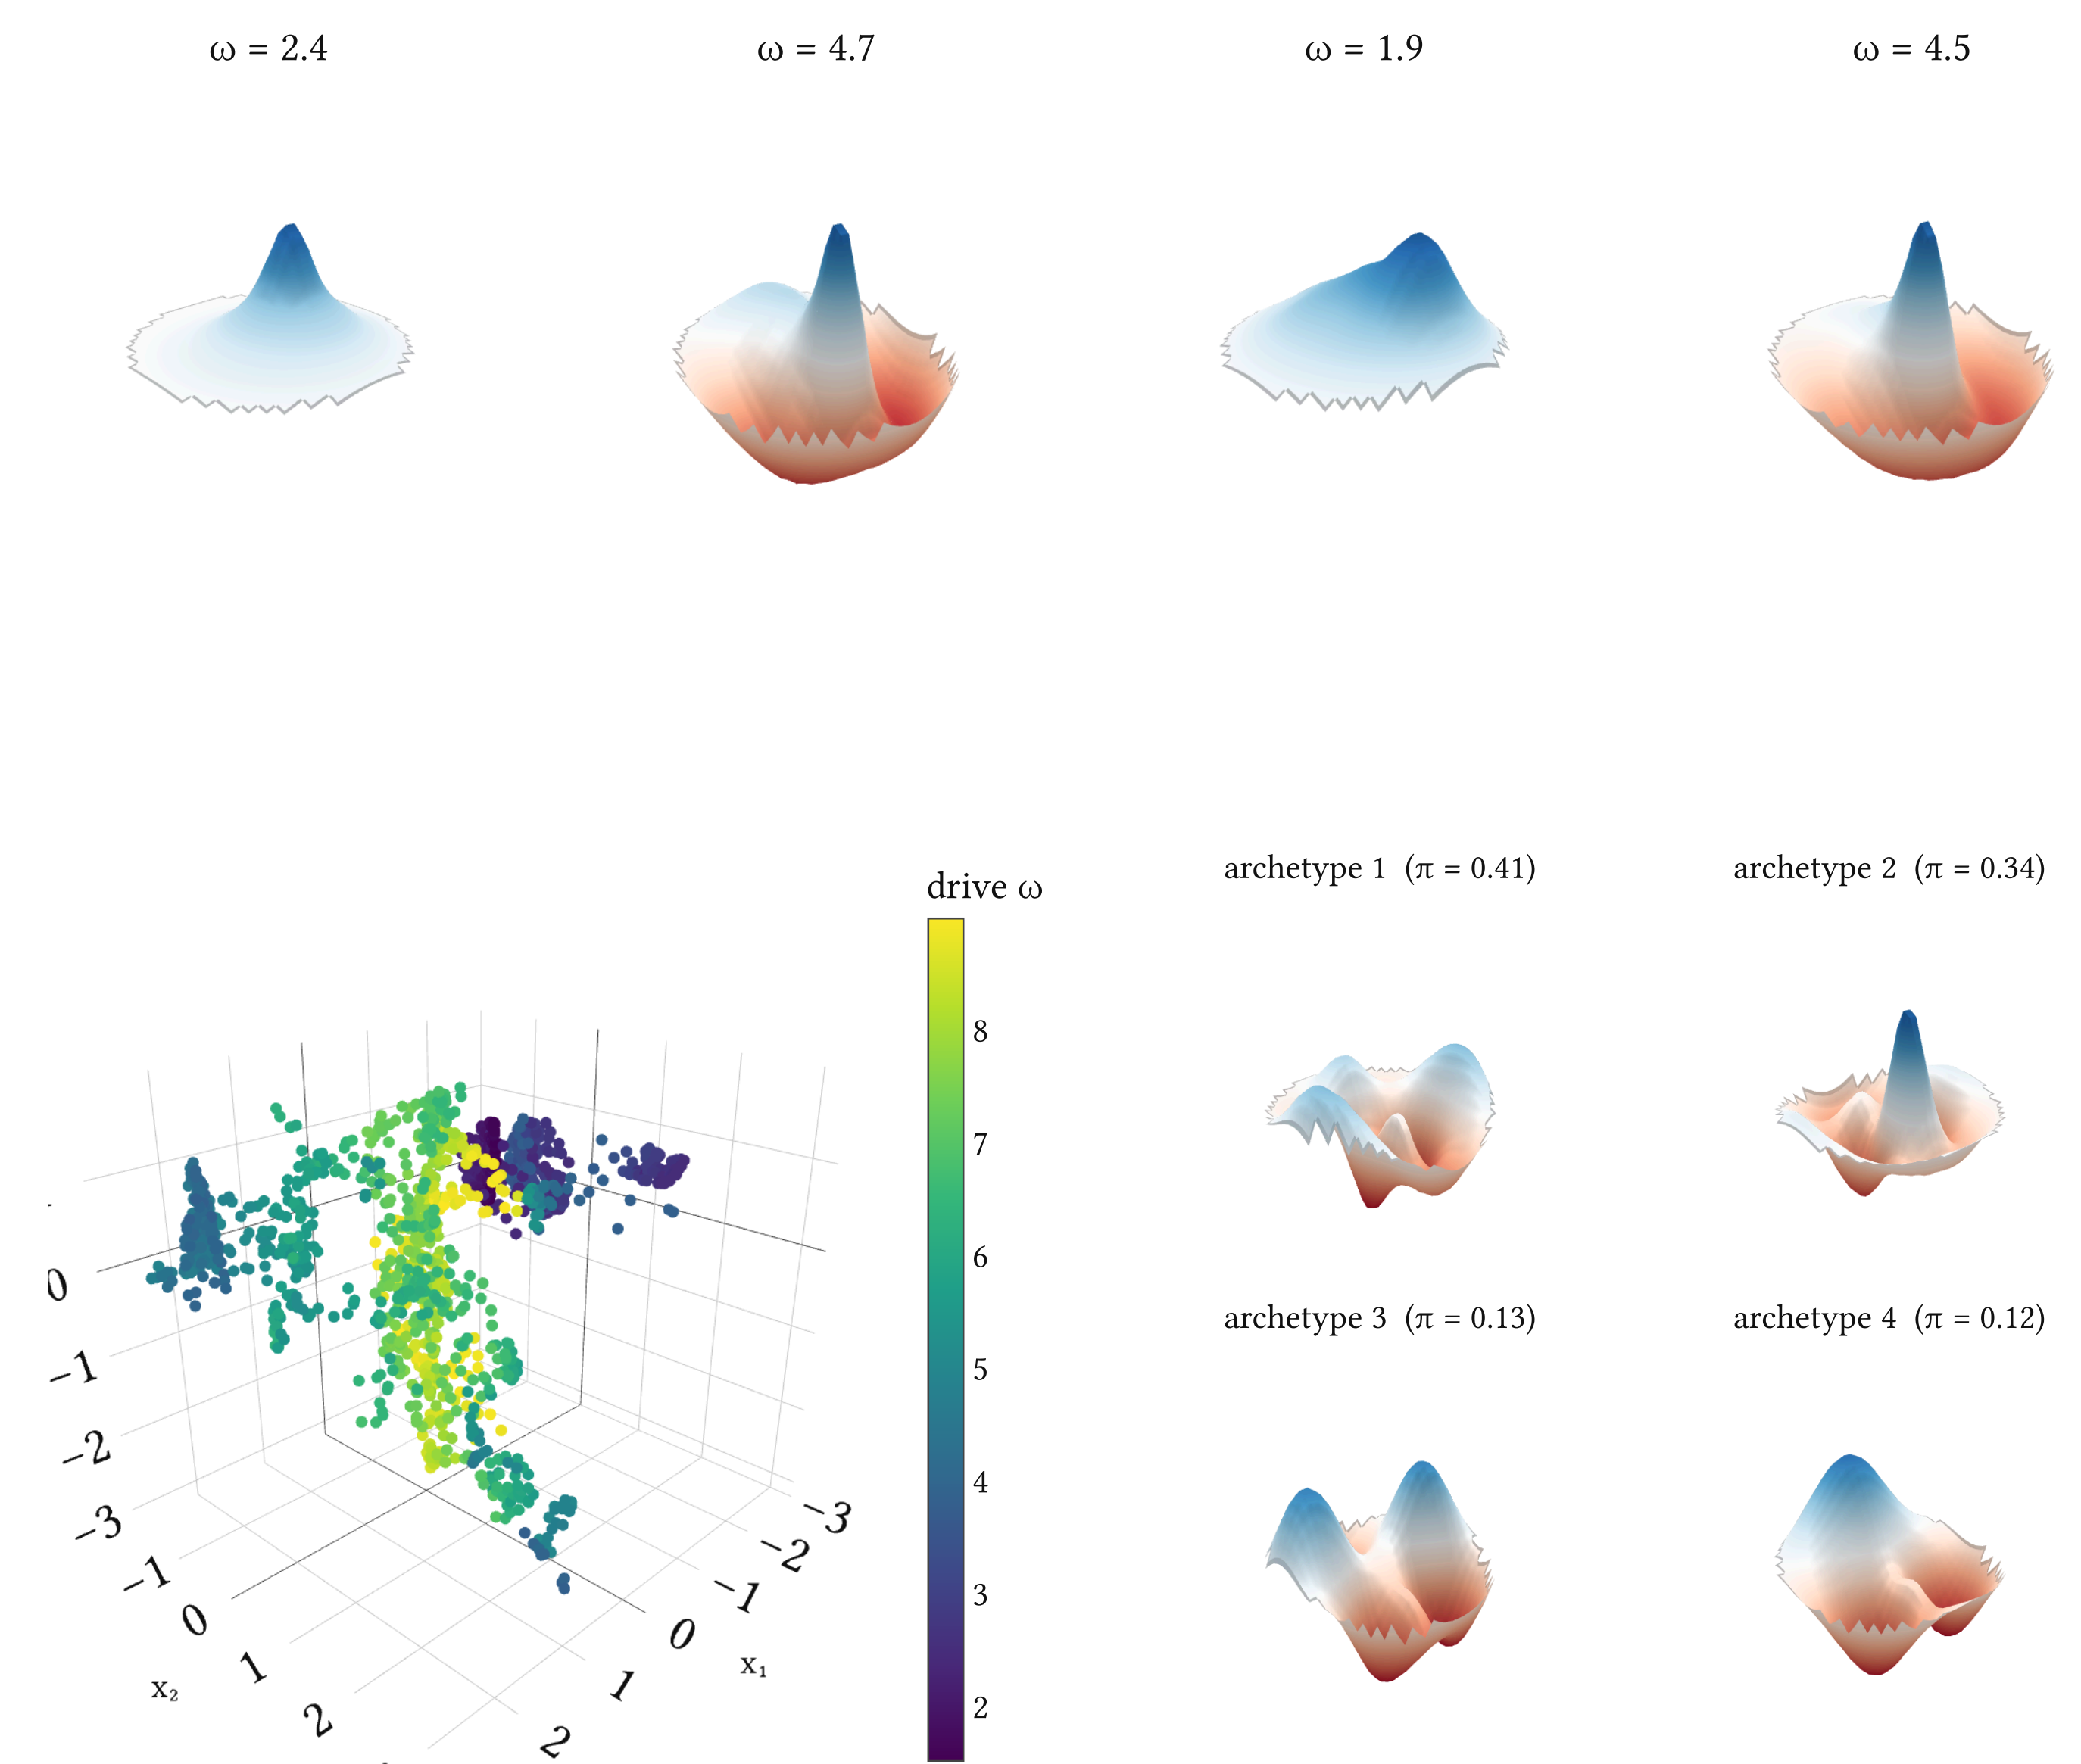

Every simulation becomes a point with its own error bar. A handful of archetypes explains them all.

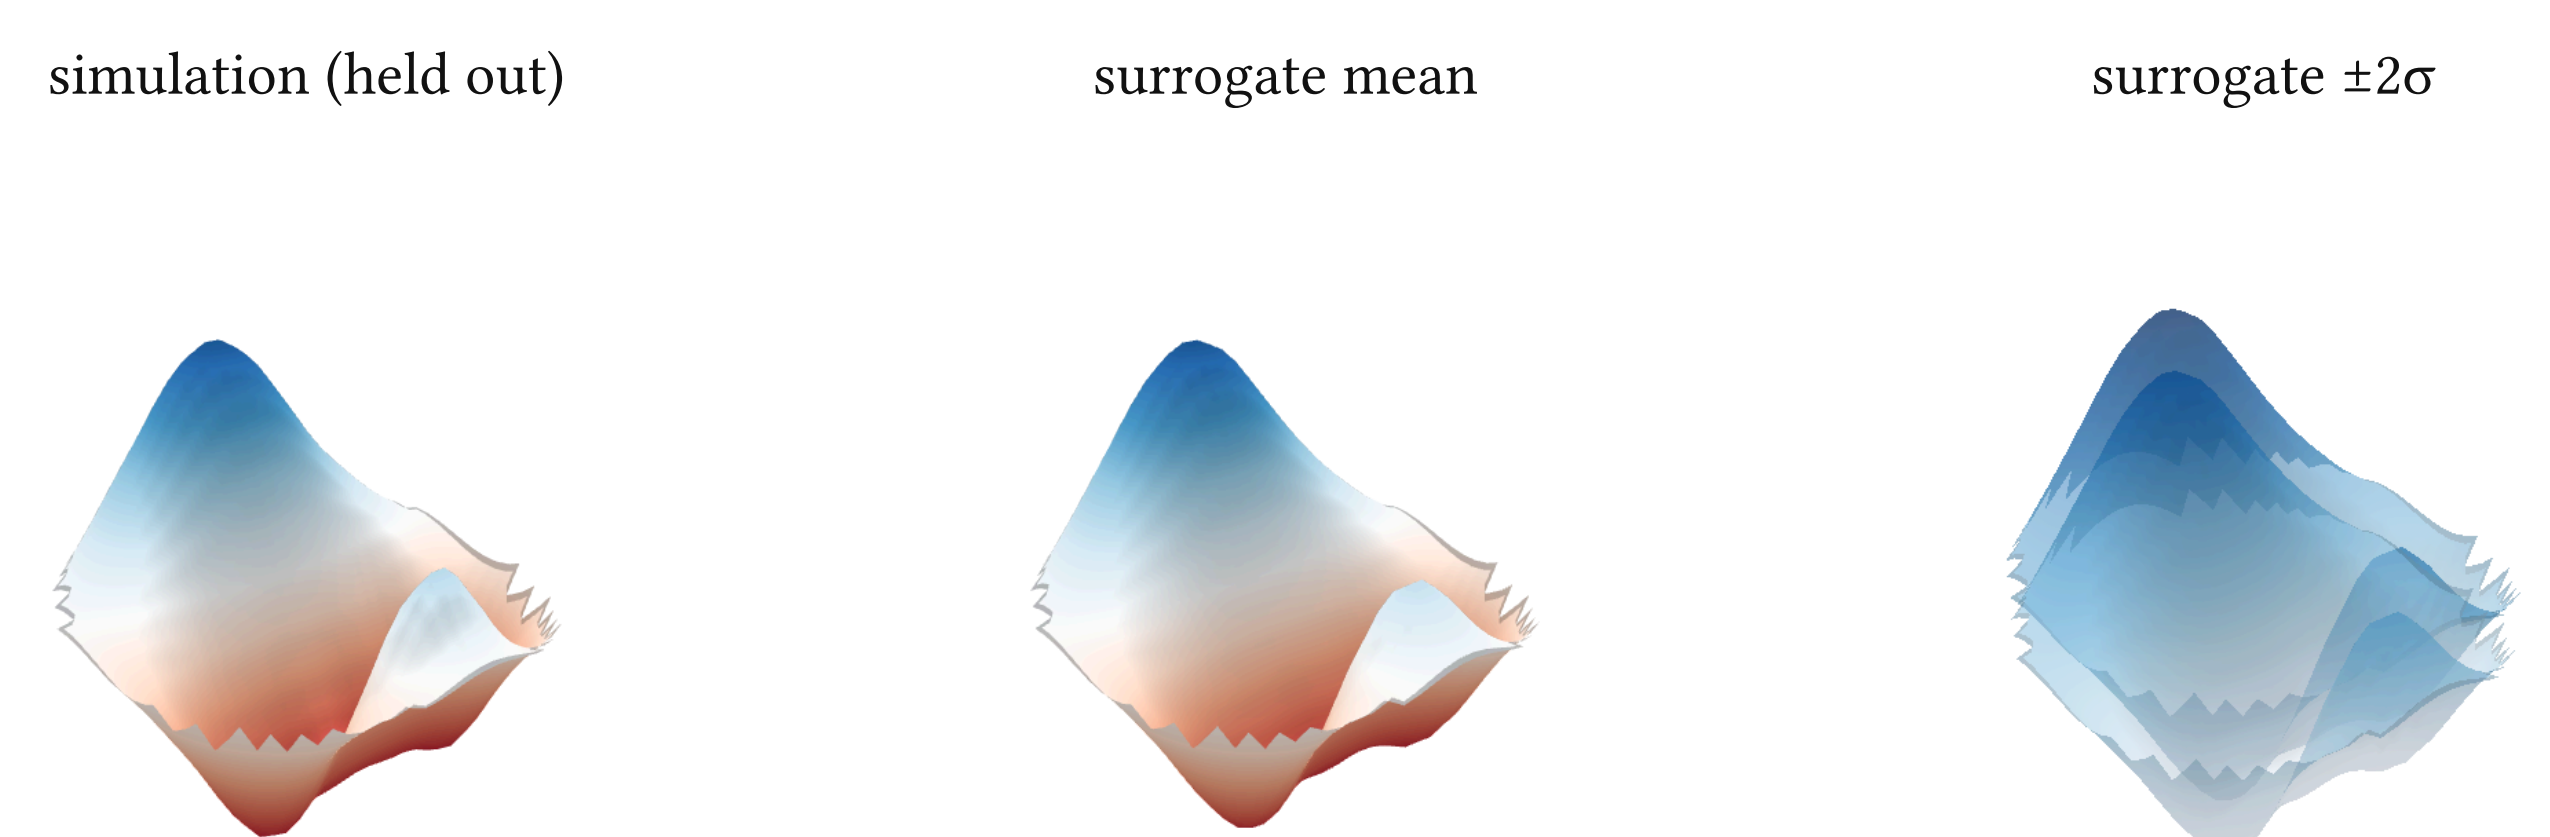

Latent map of 6,500 simulated airflow cycles, one ellipse each.

ONE METHOD, ANY SIMULATOR

1,600 driven-membrane simulations. Same pipeline, untouched.

Latent map coloured by drive frequency, and the four archetypes it learned.

A held-out simulation, its reconstruction from three numbers (8% error), and the $\pm 2\sigma$ band.

YOUR SIMULATOR HERE

Finite-element models, vibrometry, parameter sweeps you cannot afford to redo. Could this replace part of a middle-ear sweep? Bring it.
